Abstract

This project implements a console-based banking management system developed in C++. The software allows user registration, login, account management, deposits, withdrawals, balance inquiries and transaction tracking.

Introduction

The Bank Account Management System is designed to simulate basic banking operations. It provides a simple interface where users can securely access and manage their accounts.

Objectives

To learn structured programming concepts, implement file handling, manage user data, and simulate real-world banking operations.

System Working Procedure

Users register an account, log in with credentials, access the dashboard, and perform banking operations such as creating accounts, depositing money, withdrawing money, checking balances, viewing details, and reviewing transaction history.

Features

User Registration, Login Authentication, Create Account, Deposit Money, Withdraw Money, Check Balance, View Account Details, Transaction History, Delete Account, and File-Based Data Storage.

Technologies Used

Programming Language: C++. Development Environment: GCC/w64devkit. Interface: Console Based. Storage: File Handling.

Advantages

Simple user interface, easy account management, educational value, transaction tracking, and practical implementation of programming concepts.

Limitations

No graphical interface, no database integration, limited security features, and single-system operation.

Future Improvements

GUI integration, database support, encrypted passwords, online banking features, and multi-user networking support.

Conclusion

The project successfully demonstrates a functional banking management system using C++ and file handling concepts. It provides practical experience in software development and banking process simulation.
